	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Add Crop data to CSV. ● Retrieve Crop Data From CSV and display it; ● Based on the current date, display the remaining lifetime of the crop. ● Based on the current date, display the current stage of its life the crop is in.	**Schedule - (For V2.0+)** ● Colors to demonstrate lifecycle of Crops. ● Small Crop images to help individual when it comes to looking at site. ● Ability to display crop lifecycles from most urgent to least urgent.
Not Important	**Delegate - (Use a library)** ● React built in Date API instead of figuring out how to grab date from scratch. ● PapaParse library for parsing CSV instead of making a function to access csv.	**Delete - (Cut it)** ● Have the ability to tell if crops have disease. ● Use ml to have the user upload an image of crop to detect if it has disease or the time of its lifecycle. ● Use api to grab data from weather in order to determine whether or not the farmer needs to water the crops that day.

		• Be able to simulate the growth of a crop over time and see ALL the things needed to take care of it. • Have a small video game of growing the crops entered which is built in Godot. • Take a picture of a seed packet and then show farmer how it would grow over time as a prediction.
